In-Depth Treatment Procedures for 30 Common Diseases

Educational reference document for patient and caregiver awareness.

1. Type 2 Diabetes Mellitus

Goals: control glucose and prevent complications. Diagnosis includes HbA1c and glucose testing. Treatment includes lifestyle modification, weight management, metformin, additional oral medicines, GLP-1 therapies, SGLT2 inhibitors, and insulin when indicated. Monitoring includes HbA1c every 3-6 months, kidney assessment, retinal examination, and foot care.

2. Hypertension

Treatment focuses on reducing cardiovascular risk through salt restriction, weight control, exercise, stress reduction, and medications such as ACE inhibitors, ARBs, calcium channel blockers, and diuretics. Regular blood pressure monitoring is essential.

3. Coronary Artery Disease

Management includes antiplatelet therapy, statins, beta blockers, lifestyle modification, cardiac rehabilitation, angioplasty with stenting when needed, and bypass surgery for advanced disease.

4. Heart Failure

Treatment includes diuretics, ACE inhibitors, ARBs, beta blockers, SGLT2 inhibitors, fluid management, weight monitoring, advanced cardiac devices, and transplantation in selected patients.

5. Stroke

Acute treatment may include thrombolysis and thrombectomy. Long-term care includes antiplatelets, cholesterol control, blood pressure management, physiotherapy, occupational therapy, and speech rehabilitation.

6. Asthma

Controller inhalers, rescue bronchodilators, trigger avoidance, pulmonary function monitoring, and action plans for exacerbations.

7. COPD

Smoking cessation, bronchodilator therapy, inhaled medications, pulmonary rehabilitation, oxygen therapy when indicated, and vaccination.

8. Chronic Kidney Disease

Management involves blood pressure and diabetes control, nutritional therapy, anemia management, electrolyte monitoring, dialysis, and transplantation when necessary.

9. Liver Cirrhosis

Treat underlying causes, monitor complications, manage ascites, prevent bleeding, address encephalopathy, and consider transplantation.

10. Hepatitis B and C

Antiviral treatment, liver monitoring, cancer surveillance, laboratory follow-up, and lifestyle counseling.

11. Osteoarthritis

Weight loss, physiotherapy, exercise, pain management, injections, and joint replacement procedures when severe.

12. Rheumatoid Arthritis

Disease-modifying antirheumatic drugs, biologic agents, inflammation monitoring, rehabilitation, and joint preservation.

13. Osteoporosis

Calcium, vitamin D, anti-resorptive medications, fall prevention, and bone density monitoring.

14. Obesity

Structured nutrition plans, physical activity programs, behavioral therapy, anti-obesity medications, and bariatric surgery for eligible patients.

15. Hypothyroidism

Levothyroxine replacement therapy with regular thyroid hormone monitoring and dose adjustment.

16. Hyperthyroidism

Antithyroid medications, radioactive iodine therapy, surgery in selected cases, and long-term monitoring.

17. Migraine

Acute medicines, preventive therapies, trigger management, sleep optimization, and hydration.

18. Epilepsy

Antiepileptic medications, EEG monitoring, neurology follow-up, surgery or stimulation devices for selected patients.

19. Depression

Cognitive behavioral therapy, antidepressant medications, mental health support, and crisis intervention for severe symptoms.

20. Anxiety Disorder

Psychotherapy, relaxation therapy, exercise, sleep management, and medication when clinically indicated.

21. Dementia

Supportive care, cognitive interventions, caregiver training, safety planning, and symptom-oriented medications.

22. Alzheimers Disease

Cholinesterase inhibitors, memantine, cognitive stimulation, structured routines, and caregiver support.

23. Parkinsons Disease

Levodopa therapy, dopamine agonists, rehabilitation, speech therapy, and deep brain stimulation when appropriate.

24. Tuberculosis

Multi-drug therapy using guideline-based regimens, adherence monitoring, laboratory surveillance, and follow-up testing.

25. Pneumonia

Antibiotics when bacterial, hydration, oxygen support when needed, fever management, and hospitalization for severe disease.

26. Dengue Fever

Supportive treatment with careful hydration, laboratory monitoring, bleeding surveillance, and hospitalization for severe cases.

27. Malaria

Laboratory confirmation, antimalarial medicines, monitoring for complications, and intensive treatment for severe malaria.

28. GERD

Dietary modification, weight reduction, proton pump inhibitors, H2 blockers, and surgery in selected severe cases.

29. Peptic Ulcer Disease

Acid suppression, eradication of H. pylori when present, avoidance of ulcer-causing medications, and endoscopic evaluation when required.

30. Cancer

Diagnosis with imaging and biopsy, staging, treatment through surgery, chemotherapy, radiation, targeted therapy, immunotherapy, rehabilitation, nutrition, and long-term survivorship care.

Universal Treatment Principles

- Take medications exactly as prescribed.
- Attend scheduled follow-up visits.
- Maintain healthy nutrition and hydration.
- Exercise according to medical advice.
- Avoid tobacco and harmful substances.
- Monitor symptoms and seek early medical attention for worsening conditions.

• Maintain vaccination schedules and preventive screenings.
